PREFACE

This product specification covers the work performed under Air Force Contract F33615-80-C-5155 (ICAM Project 6201). This contract is sponsored by the Materials Laboratory, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio. It was administered under the technical direction of Mr. Gerald C. Shumaker, ICAM Program Manager, Manufacturing Technology Division, through Project Manager, Mr. David Judson. The Prime Contractor was Production Resources Consulting of the General Electric Company, Schenectady, New York, under the direction of Mr. Alan Rubenstein. The General Electric Project Manager was Mr. Myron Hurlbut of Industrial Automation Systems Department, Albany, New York.

Certain work aimed at improving Test Bed Technology has been performed by other contracts with Project 6201 performing integrating functions. This work consisted of enhancements to Test Bed software and establishment and operation of Test Bed hardware and communications for developers and other users. Documentation relating to the Test Bed from all of these contractors and projects have been integrated under Project 6201 for publication and treatment as an integrated set of documents. The particular contributors to each document are noted on the Report Documentation Page (DD1473). A listing and description of the entire project documentation system and how they are related is contained in document FTR620100001, Project Overview.

The subcontractors and their contributing activities were as follows:

TASK 4.2

<u>Subcontractors</u>	<u>Role</u>
Boeing Military Aircraft Company (BMAC)	Reviewer
D. Appleton Company (DACOM)	Responsible for IDEF support, state-of-the-art literature search
General Dynamics/ Ft. Worth	Responsible for factory view function and information models

<u>Subcontractors</u>	<u>Role</u>
Illinois Institute of Technology	Responsible for factory view function research (IITRI) and information models of small and medium-size business
North American Rockwell	Reviewer
Northrop Corporation	Responsible for factory view function and information models
Pritsker and Associates	Responsible for IDEF2 support
SofTech	Responsible for IDEF0 support

TASKS 4.3 - 4.9 (TEST BED)

<u>Subcontractors</u>	<u>Role</u>
Boeing Military Aircraft Company (BMAC)	Responsible for consultation on applications of the technology and on IBM computer technology.
Computer Technology Associates (CTA)	Assisted in the areas of communications systems, system design and integration methodology, and design of the Network Transaction Manager.
Control Data Corporation (CDC)	Responsible for the Common Data Model (CDM) implementation and part of the CDM design (shared with DACOM).
D. Appleton Company (DACOM)	Responsible for the overall CDM Subsystem design integration and test plan, as well as part of the design of the CDM (shared with CDC). DACOM also developed the Integration Methodology and did the schema mappings for the Application Subsystems.

<u>Subcontractors</u>	<u>Role</u>
Digital Equipment Corporation (DEC)	Consulting and support of the performance testing and on DEC software and computer systems operation.
McDonnell Douglas Automation Company (McAuto)	Responsible for the support and enhancements to the Network Transaction Manager Subsystem during 1984/1985 period.
On-Line Software International (OSI)	Responsible for programming the Communications Subsystem on the IBM and for consulting on the IBM.
Rath and Strong Systems Products (RSSP) (In 1985 became McCormack & Dodge)	Responsible for assistance in the implementation and use of the MRP II package (PIOS) that they supplied.
SofTech, Inc.	Responsible for the design and implementation of the Network Transaction Manager (NTM) in 1981/1984 period.
Software Performance Engineering (SPE)	Responsible for directing the work on performance evaluation and analysis.
Structural Dynamics Research Corporation (SDRC)	Responsible for the User Interface and Virtual Terminal Interface Subsystems.

Prime contractors under other projects who have contributed to Test Bed Technology, their contributing activities and responsible projects are as follows:

<u>Contractors</u>	<u>ICAM Project</u>	<u>Contributing Activities</u>
Boeing Military Aircraft Company (BMAC)	1701, 2201, 2202	Enhancements for IBM node use. Technology Transfer to Integrated Sheet Metal Center (ISMС)

## SECTION 1

### SCOPE

#### 1.1 Identification

This specification establishes the detailed design of a computer program identified as the Forms Driven Form Editor, hereinafter referred to as FDFE. The FDFE is one configuration item of the Integrated Information Support System (IISS) User Interface (UI).

#### 1.2 Functional Summary

The FDFE is a software tool for creating and initializing form definitions. The FDFE displays a series of screens which request information from the user and visually show the form under construction. Once a form has been completed, the FDFE stores the form definition constructs needed to recreate the form. The stored form can be selected and modified.

The runtime UI or UIMS views the FDFE, which is part of the UIDS, as an application program which uses the Form Processor. Data to be selected or stored comes from or is passed to the Common Data Model (CDM) in the integrated implementation; otherwise, a file system is used. The FDFE also interacts with the Forms Language Compiler (FLAN) to translate between the forms language source and the compiled form definition.

The FDFE is a C program which makes extensive use of form language sources and compiled forms, performs interactive user input/output via the Form Processor (FP), and uses the FP to manage the compiled forms. The internal form data structure is the same as that used by the Form Processor.

## 2.2 Terms and Abbreviations

American Standard Code for Information Interchange: (ASCII), the character set defined by ANSI X3.4 and used by most computer vendors.

Application Interface: (AI), subset of the IISS User Interface that consists of the callable routines that are linked with applications that use the Form Processor or Virtual Terminal. The AI enables applications to be hosted on computers other than the host of the User Interface.

Application Process: (AP), a cohesive unit of software that can be initiated as a unit to perform some function or functions.

Attribute: field characteristic such as blinking, highlighted, black, etc. and various other combinations. Background attributes are defined for forms or windows only. Foreground attributes are defined for items. Attributes may be permanent, i.e., they remain the same unless changed by the application program, or they may be temporary, i.e., they remain in effect until the window is redisplayed.

Device Drivers: (DD), software modules written to handle I/O for a specific kind of terminal. The modules map terminal specific commands and data to a neutral format. Device Drivers are part of the UI Virtual Terminal.

Display List: is similar to the open list, except that it contains only those forms that have been added to the screen and are currently displayed on the screen.

Extended Binary Coded Decimal Interchange Code: (EBCDIC), the character set used by a few computer vendors (notably IBM) instead of ASCII.

Field: two dimensional space on a terminal screen.

Form: structured view which may be imposed on windows or other forms. A form is composed of fields. These fields may be defined as forms, items, and windows.

Form Definition: (FD), forms definition language after compilation. It is read at runtime by the Form Processor.

Forms Definition Language: (FDL), the language in which electronic forms are defined.

Forms Driven Form Editor: (FDFE), subset of the FE which consists of a forms driven application used to create Form Definition files interactively.

Form Editor: (FE), subset of the IISS User Interface that is used to create definitions of forms. The FE consists of the Forms Driven Form Editor and the Forms Language Compiler.

Form Hierarchy: a graphic representation of the way in which forms, items and windows are related to their parent form.

Forms Language Compiler: (FLAN), subset of the FE that consists of a batch process that accepts a series of forms definition language statements and produces form definition files as output.

Form Processor: (FP), subset of the IISS User Interface that consists of a set of callable execution time routines available to an application program for form processing.

Form Processor Text Editor: (FPTE), subset of the Form Processor that consists of software modules that provide text editing capabilities to all users of applications that use the Form Processor.

IISS Function Screen: the first screen that is displayed after logon. It allows the user to specify the function he wants to access and the device type and device name on which he is working.

Integrated Information Support System: (IISS), a test computing environment used to investigate, demonstrate and test the concepts of information management and information integration in the context of Aerospace Manufacturing. The IISS addresses the problems of integration of data resident on heterogeneous data bases supported by heterogeneous computers interconnected via a Local Area Network.

Item: non-decomposable area of a form in which hard-coded descriptive text may be placed and the only defined areas where user data may be input/output.

Message: descriptive text which may be returned in the standard message line on the terminal screen. They are used to warn of errors or provide other user information.

Message Line: a line on the terminal screen that is used to display messages.

Network Transaction Manager: (NTM), IISS subsystem that performs the coordination, communication and housekeeping functions required to integrate the Application Processes and System Services resident on the various hosts into a cohesive system.

Open List: a list of all the forms that have been and are currently open for an application process.

Operating System: (OS), software supplied with a computer which allows it to supervise its own operations and manage access to hardware facilities such as memory and peripherals.

Page: instance of forms in windows that are created whenever a form is added to a window.

Paging and Scrolling: a method which allows a form to contain more data than can be displayed with provisions for viewing any portion of the data buffer.

Physical Device: a hardware terminal.

Qualified Name: the name of a form, item or window preceded by the hierarchy path so that it is uniquely identified.

Subform: a form that is used within another form.

User Data: data which is either input by the user or output by the application programs to items.

User Interface: (UI), IISS subsystem that controls the user's terminal and interfaces with the rest of the system. The UI consists of two major subsystems: the User Interface Development System (UIDS) and the User Interface Management System (UIMS).

User Interface Development System: (UIDS), collection of IISS User Interface subsystems that are used by applications programmers as they develop IISS applications. The UIDS includes the Form Editor and the Application Generator.

User Interface Management System: (UIMS), the runtime UI. It consists of the Form Processor, Virtual Terminal, Application Interface, the User Interface Services and the Text Editor.

User Interface Monitor: (UIM), part of the Form Processor that handles messaging between the NTM and the UI. It also provides authorization checks and initiates applications.

User Interface Services: (UIS), subset of the IISS User Interface that consists of a package of routines that aid users in controlling their environment. It includes message management, change password, and application definition services.

User Interface/Virtual Terminal Interface: (UI/VTI), another name for the User Interface.

Virtual Terminal: (VT), subset of the IISS User Interface that performs the interfacing between different terminals and the UI. This is done by defining a specific set of terminal features and protocols which must be supported by the UI software which constitutes the virtual terminal definition. Specific terminals are then mapped against the virtual terminal software by specific software modules written for each type of real terminal supported.

Window: dynamic area of a terminal screen on which predefined forms may be placed at run time.

Window Manager: a facility which allows the following to be manipulated: size and location of windows, the device on which an application is running, the position of a form within a window. It is part of the Form Processor.

#### REQUIREMENTS

##### 3.1 Structural Description

The general approach is to view the FDFE as a hierarchy of modules. The FDFE screens presented in the appendix are associated with only certain modules in the hierarchy based on the functionality being performed by the module.

###### 3.1.1 Module Hierarchy

The following hierarchy chart shows the organization of the FDFE:

PS 62014402  
1 November 1985

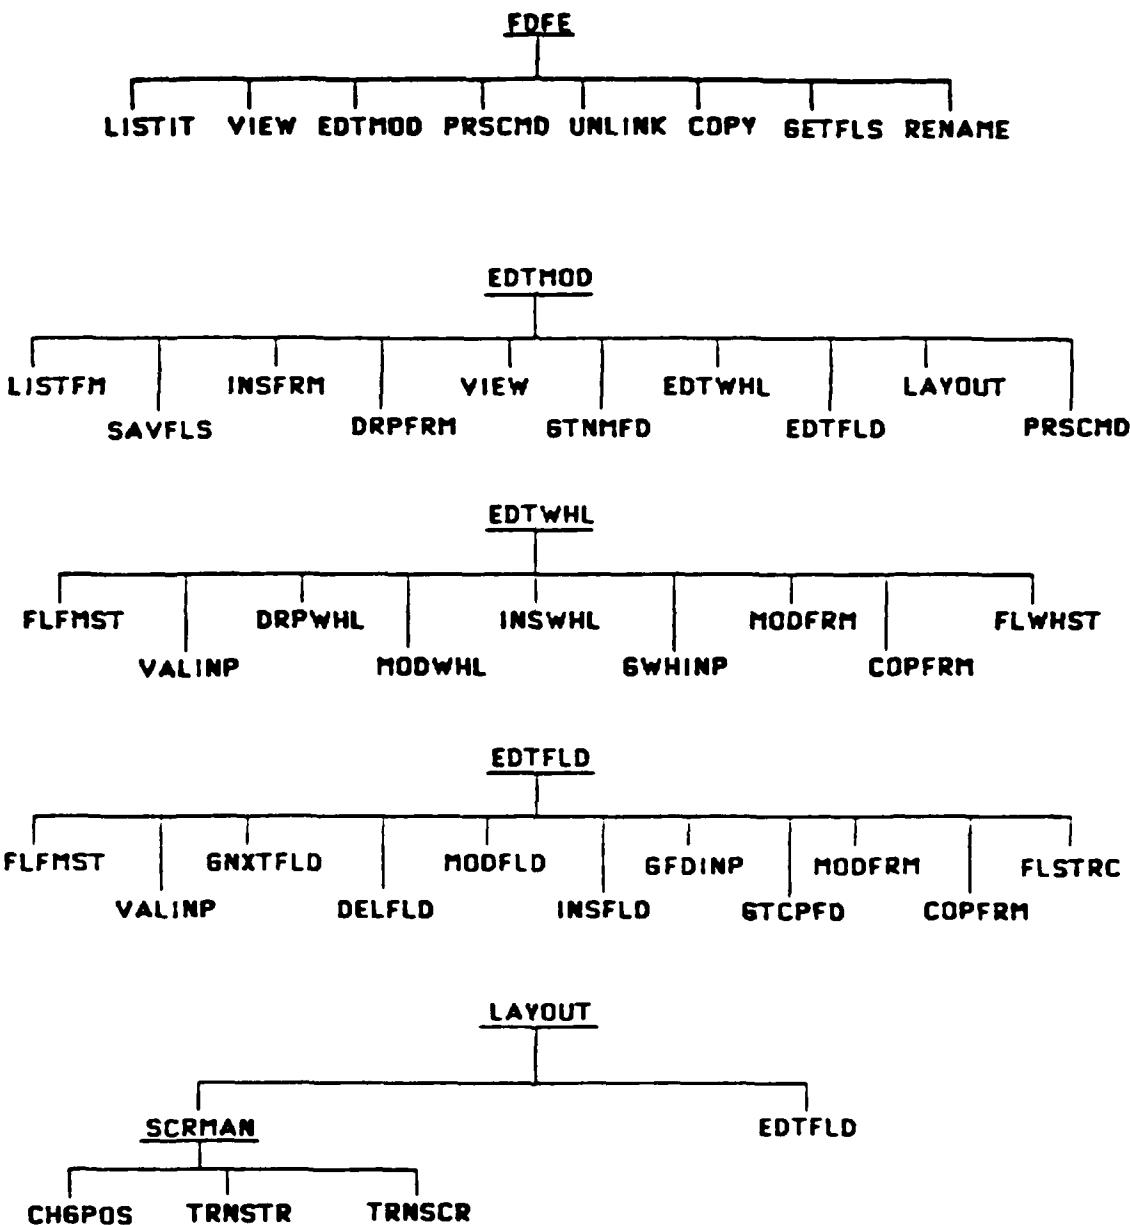

Figure 3-1 FDFE Hierarchy Charts

### **3.1.2 Module Descriptions**

The following paragraphs describe the modules associated with each of the major sections of the FDFE.

#### **3.1.2.1 FDFE:**

This module is the main driver. It allows the user to choose among several file management options or to proceed to the edit task level. It controls the WRKTASK screen.

**Input Parameters:**

None

**Output Parameters:**

None

#### **3.1.2.2 PRSCMD:**

This module parses the command line for both the WRKTASK and EDTTASK screens to determine which other modules are to be called and what parameters are to be passed.

**Input Parameters:**

Pointer to command line

Array of parameter counts

Array of pointers to valid commands

**Output Parameters:**

Option chosen

Pointer to parameters to be passed to the module which will execute the option.

Number of parameters found in command line

#### **3.1.2.3 LISTIT:**

This module lists all of the Forms Definition Object or Forms Language Source in the user's specified forms language source or definition object libraries.

**Input Parameters:**

Pointer to "FDL" or "FD" string

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**3.1.2.4 VIEW:**

This module displays a form just as it would appear on the screen when used by a program.

**Input Parameters:**

Pointer to name of form to view

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**3.1.2.5 FORMS LANGUAGE SOURCE ACCESS MODULES:**

**o UNLINK:**

This module drops a particular Forms Language Source.

**Input Parameters:**

Name of Forms Language Source

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**o COPY:**

This module copies a particular Forms Language Source to another Forms Language Source of specified name.

**Input Parameters:**

Name of existing "from" Forms Language Source

Name of new or "to" Forms Language Source

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**o RENAME:**

This module renames a particular Forms Language Source to a specified name.

**Input Parameters:**

Name of existing Forms Language Source

New name of Forms Language Source

**Output Parameters:**

Returns any error code or a NULL pointer if successful

PS 620144402  
1 November 1985

o **GETFLS:**

This module retrieves a particular Forms Language Source and translates it into the internal data structure.

**Input Parameters:**

Name of existing Forms Language Source

**Output Parameters:**

Pointer to the "opened" form, the internal Forms Processor data structure

o **SAVFLS:**

This module saves a particular Forms Language Source (fdl file) and a Forms Definition Object (fd file) after it translates the internal data structure into forms language syntax.

**Input Parameters:**

Name of the form to be saved under flag indicating to write or not to write out the fd file

Pointer to list of forms to be written out

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**3.1.2.6 EDTMOD:**

This module is the control module for all edit tasks. It controls the EDTTASK screen.

**Input Parameters:**

New/old form flag

Change/retrieve only flag

**Output Parameters:**

Returns any error code or a NULL pointer if successful

**3.1.2.7 LISTFM:**

This module lists all forms in the Forms Language Source on which work is being done.

**Input Parameters:**

None

**Output Parameters:**

Returns any error codes or NULL pointer if successful

**3.1.2.8 INSFRM:**

This module inserts a new form into the Forms Language Source on which work is being done.

**Input Parameters:**

name of form

**Output Parameters:**

Returns any error code or NULL pointer if successful

**3.1.2.9 DRPFRM:**

This module deletes a form from the Forms Language Source on which work is being done.

**Input Parameters:**

Name of form

**Output Parameters:**

Returns any error codes or NULL pointer if successful

**3.1.2.10 EDTWHL:**

This module allows the user to edit an entire form at once. It controls the presentation of the FORM EDIT screen.

**Input Parameters:**

Read-only flag

Name of form

**Output Parameters:**

Returns any error code or NULL pointer if successful

**3.1.2.11 EDTFLD:**

This module allows the user to edit all fields of a form one at a time. It controls the presentation of the FIELD EDIT screen. It is also called from LAYOUT.

**Input Parameters:**

Read-only flag

col cursor position if coming from layout mode

row cursor position if coming from layout mode

pointer to internal form structure

edit mode

**Output Parameters:**

Returns any error code or NULL pointer if successful

PS 620144402  
1 November 1985

### **3.1.2.12 LAYOUT:**

This module allows the user to edit an entire form as it would appear when used (with regards to the location and size of fields) on one screen. The other needed information is filled in on the LAYOUT DESCRIPTION screen.

**Input Parameters:**

Pointer to internal form structure

Read-only fla

**Output Parameters:**

Returns any error code or NULL pointer if successful

### **3.1.2.13 SCRMAN:**

This module controls the first stage of layout edit mode - it manages the screen using the following three modules to translate internal structure to screen layout and vice versa.

**Input Parameters:**

Read-only flag

pointer to internal form structure

**Output Parameters:**

Row position returned from GETCUR

Col position returned from GETCUR

### **3.1.2.14 CHGPOS:**

This module allows the user to change the location of a field in layout mode by indicating the "from" and "to" locations on the screen.

**Input Parameters:**

pointer to internal form structure

**Output Parameters:**

Returns any error code or NULL pointer if successful

### **3.1.2.15 TRNSCR:**

This module translates the layout screen format to internal structure.

**Input Parameters:**

Pointer to internal form structure

**Output Parameters:**

Returns any error code or NULL pointer if successful

PS 620144402  
1 November 1985

**3.1.2.16 TRNSTR:**

This module translates the internal structure to the layout screen format.

**Input Parameters:**

Pointer to internal form structure

Read only flag

**Output Parameters:**

None

**3.1.2.17 VALINP:**

This module performs validation checks on fields. The objects to be validated are the values input on the FIELD EDIT and FORM EDIT screens.

**Input Parameters:**

Pointer to form to be validated

Pointer to field to be validated

Flag indicating type of validation

**Output Parameters:**

Returns TRUE if validation okay else returns FALSE

**3.1.2.18 GTMNFD:**

This module retrieves fields from the internal structure.

**Input Parameters:**

Pointer to 1st field in internal structure

Name of field to find

**Output Parameters:**

Pointer to field in the internal structure or NULL if could not find field

**3.1.2.19 MODFLD:**

This module modifies a field in the internal structure.

**Input Parameters:**

Pointer to parent of field

Pointer to pointer of field being modified

Pointer to screen changed information

Pointer to screen help info

PS 620144402  
1 November 1985

Pointer to screen value info  
Pointer to screen item info  
Output Parameters:  
Returns any error code or NULL pointer if successful

3.1.2.20 DEFLD:

This module deletes a field from the internal structure.  
This is the same function as that used by the Form Processor.

3.1.2.21 INSFLD:

This module inserts a field into the internal structure.

Input Parameters:  
Address of pointer to field being inserted  
Address where next field pointer will be inserted  
Address where previous field pointer will be inserted  
Pointer to parent of field  
Pointer to screen field information  
Pointer to screen help info  
Pointer to screen value info  
Pointer to screen item info  
Recursion level  
Output Parameters:  
Returns any error code or NULL pointer if successful

3.1.2.22 COPFRM:

This module copies a Forms Language Source file into an alternate internal data structure and gets the pointer to the specified form.

Input Parameters:  
Name of Forms Language Source file to copy from  
Name of form to copy  
Output Parameters:  
Sets global variables:  
Copyfls, name of Forms Language Source just copied  
Copyfrm, name of form just copied  
Altbuf, beginning of list containing all forms of  
Forms Language Source  
Altfrm, pointer to form user wishes to copy

PS 620144402  
1 November 1985

**3.1.2.23 MODFRM:**

This module updates information about the form.

**Input Parameters:**

Pointer to form internal structure  
Pointer to screen form information

**Output Parameters:**

Returns any error code or NULL pointer if successful

**3.1.2.24 FLFMST:**

This module translates an FPD field structure for a form into the screen information structure.

**Input Parameters:**

Pointer to screen structure  
Pointer to fpd form field

**Output Parameters:**

None

**3.1.2.25 FLSTRC:**

This module translates the FPD field structure to screen information structure for items, windows, and forms.

**Input Parameters:**

Pointer to fpd field  
Pointer to screen field structure  
Pointer to screen item help structure  
Pointer to screen item value structure  
Pointer to screen field domain check structure

**Output Parameters:**

Fills appropriate screen area with field information

**3.1.2.26 FLWHST:**

This module fills in the output screen FORM EDIT, and associates each field line on the output screen with the field's internal structure.

**Input Parameters:**

Pointer to form internal structure on which editing is to occur.

PS 620144402  
1 November 1985

**Output Parameters:**

Fills output screen FORM EDIT area with form and field info and creates an external array of pointers

**3.1.2.27 GWHINP:**

This module gets all input for the FORM EDIT screen for the fields on the form being edited.

**Input Parameters:**

Pointer to form internal structure

**Output Parameters:**

PF key provided by OISCR

Returns any error code or NULL pointer if successful

**3.1.2.28 GTCPFD:**

This module gets the field at the located cursor position.

**Input Parameters:**

Pointer to form internal structure

Row cursor position

Col cursor position

**Output Parameters:**

Pointer to field at that location else

NULL if no field found

**3.1.2.29 DRPWHL:**

This module deletes all fields marked by the user on the FORM EDIT screen.

**Input Parameters:**

Pointer to internal form structure

**Output Parameters:**

PF key received by OISCR

**3.1.2.30 MODWHL:**

This module modifies existing fields as input by the user on the FORM EDIT screen.

**Input Parameters:**

Pointer to parent of field

Pointer to field being modified

Pointer to input screen structure

Pointer to help line on screen

PS 620144402  
1 November 1985

Pointer to item value on screen  
Pointer to item only info on screen  
Output Parameters:  
Returns any error code or NULL pointer if successful

### 3.1.2.31 INSWHL:

This module inserts all fields that have been entered on the FORM EDIT screen.

Input Parameters:  
Pointer to form internal structure  
Output Parameters:  
Returns any error code or NULL pointer if successful

## 3.2 Functional Flow

Figure 3-2 is a data flow for the Forms Driven Form Editor.

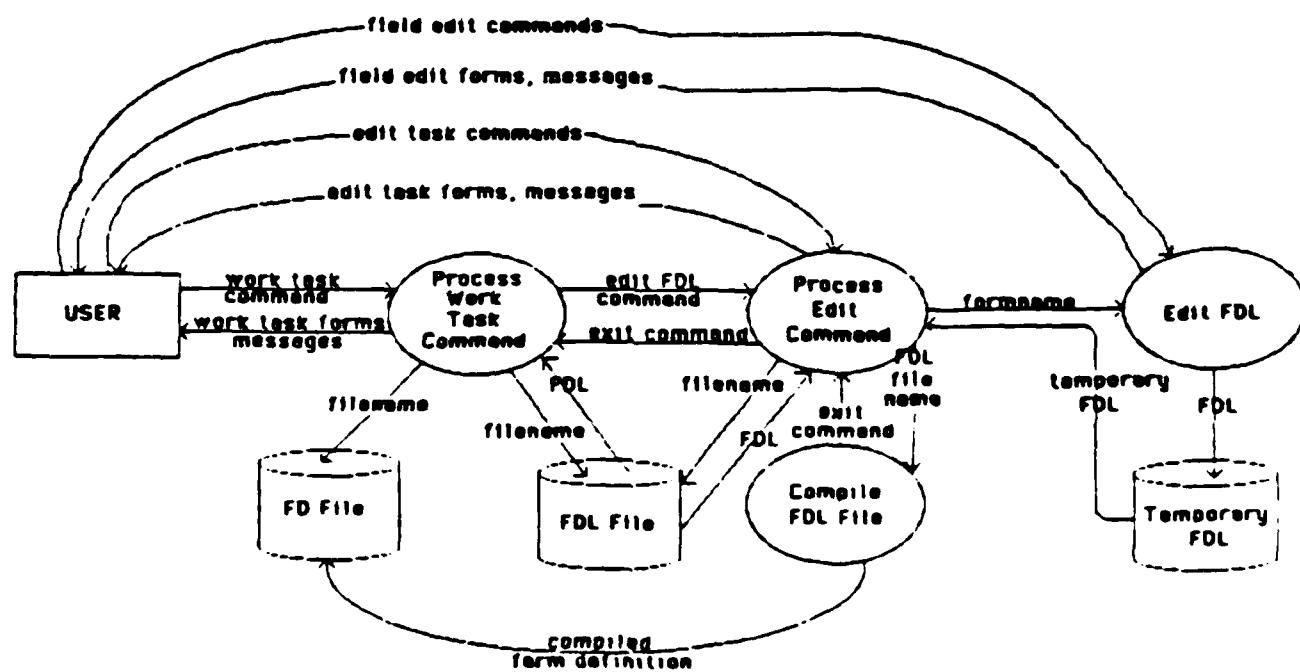

Figure 3-2 FDFE Data Flow

### 3.3 Interfaces

The FDFE interfaces directly with users as an IISS application. Physical terminals are assumed to have video display, a textual keyboard, four cursor positioning keys or key sequences, a help key or key sequence, an entry key, and four other keys to be used by the FDFE for special processing. The FDFE must interface with the AI, FLAN, and the operating system.

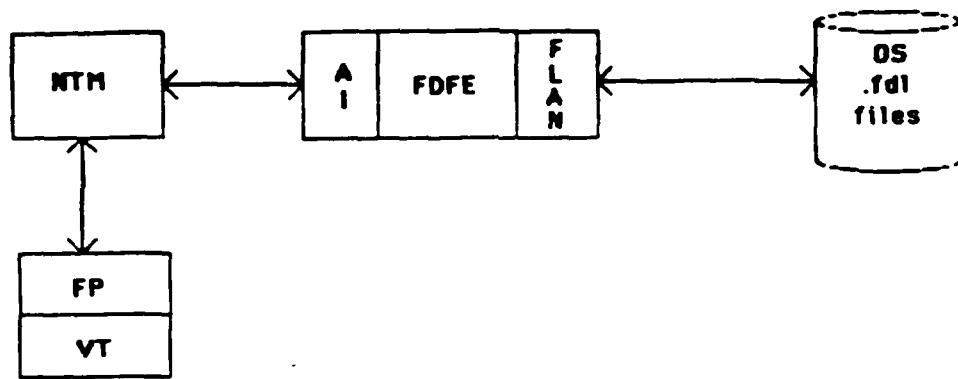

Figure 3-3 FDFE Interface Diagram

#### 3.3.1 Application Interface

The FDFE interacts with users by calling appropriate routines of the Application Interface (AI). This interface creates messages which are sent to the Form Processor which moves information describing interactive terminal input and output and provides a link to users of the FDFE through the Virtual Terminal.

#### 3.3.2 Forms Language Compiler

The FDFE uses the Forms Language Complier (FLAN) to convert forms language source into the Form Processor internal forms

structure. The FDFE also invokes the FLAN when the form under construction is to be stored.

### 3.3.3 Operating System

The FDFE stores form language source files (fdl files on the VAX) and compiled form definitions (fd files on the VAX). Form language source files may subsequently be compiled and displayed. The storage of the fdl files and fd files is system dependent. The VAX implementation uses the logicals IISSSLIB (for fdl files) to store/retrieve the files in/from the appropriate directory.

### 3.4 Program Interrupts

This section does not apply to the detailed design of the Forms Driven Form Editor.

### 3.5 Timing and Sequencing Description

The data flow diagram in section 3.2 and the detail design description in section 3.10 contain the procedural information for sequencing and control logic.

### 3.6 Special Control Features

The detailed design of the FDFE does not include any special control features as defined in the ICAM Documentation Standards manual.

### 3.7 Storage Allocation

The Forms Driven Form Editor executable is 351 blocks.

#### 3.7.1 Data Base Definition

##### 3.7.1.1 File Descriptions

1. FILE NAME: name.FDL - Form Definition Language file.

PURPOSE: This file contains the language description of one or more forms. Compiling this file produces Form Definition files.

DECLARATION:

```
char line [132];
```

2. FILE NAME: name.TMP - Temporary FDL file.

PURPOSE: This file contains the language description of one or more forms. It is created during an editing session from the FDFE's internal data structure. If this file compiles successfully, it is renamed to an FDL file, otherwise it remains so that the user can correct errors and recompile it.

DECLARATION:

```
char line [132];
```

3. FILE NAME: formname.FD - Form Definition file. The name of this file is dependent upon the form it describes.

PURPOSE: This file contains information about the structure and attributes of a form that is used at run time by the Form Processor.

DECLARATION:

```
typedef struct      /* version number record */

```

### 3.8 Object Code Creation

The FDFE routines were compiled using a C compiler developed by Interactive Software under VAX/VMS.

PS 620144402  
1 November 1985

### 3.9 Adaptation Data

The C source modules for the FDFE can be compiled using any UNIX version 7 compatible C compiler. The files FPDINI.H and GETFLS.C contain file names for the Form Definition and Form Definition Language files which may not port to systems other than VAX/VMS.

### 3.10 Detailed Design Description

#### 3.10.1 Main Program List

The following is a list of all "Main Programs" which are modules that are not called by any other module being documented here. These modules are either program entry points or, if they are hooked into another set of programs via subroutine calls, they are the points the external programs can call and therefore enter through. To differentiate between the two types of entry points, look at the individual Module Documentation (section 3.10.8) and look at Module Type for each of the Main Program modules listed. Note whether the routine is a Program, Subroutine, or Function. If it is a Program, it is truly a main program entry point. If not, then it is merely called by other programs not being documented here.

### 3.10.4 Include File List

The following is a list of all include files called in by modules being documented here. Each include file has a unique name regardless of the language being used. The purpose of each include file is listed as well. A more complete description of each include file is given in section 3.10.9. The purpose listed is the one that is in the source code of the include file.

A purpose of "\*\*\*\* PURPOSE NOT FOUND BY STRIPPER \*\*\*\*" indicates that a purpose statement was not written into the include file itself. The most common reason for this is that the include file comes from system libraries that were not developed by the project, such as 'C' libraries that are provided with the 'C' compiler.

See section 3.10.6 for a set of lists which show all the modules which call in each of these include files.

### 3.10.7 Main Program Parts List

The following lists each Main Program listed in 3.10.1 and all the modules which are called either by that module itself or by any of the documented modules which it calls. It is possible for a non-main module to be listed more than once if it is called by multiple modules. The called modules, in this case known as program parts, are marked as to whether they are documented here. If so, the phrase "well-defined module" appears by the module name, if not it is an "external routine". The Purpose of the Main Program module is listed as well.

### **3.10.8 Module Documentation**

The following documentation describes information which is specific to each individual module being documented in this specification as listed in section 3.10.2. It provides a compact way of getting information that would be otherwise buried within each module's source code.

The specific items in this module documentation have the following meanings:

<b>NAME:</b>	Name of program Module.
<b>PURPOSE:</b>	Purpose of Module as detailed in the source code.
<b>LANGUAGE:</b>	Programming language source code is written in. The choices are: VAX-11 FORTRAN
C	(I/S-1 Workbench 'C') VAX-11 COBOL
<b>MODULE TYPE:</b>	Whether a Program, Subroutine, or Function.
<b>SOURCE FILE:</b>	Name of Source File from file specification.
<b>SOURCE FILE TYPE:</b>	Source File Extension from file specification.
<b>HOST:</b>	Whether this is a host-dependent routine (VAX or IBM) or blank if host-independent.
<b>SUBSYSTEM:</b>	IISS sub-system this file resides in.
<b>SUBDIRECTORY:</b>	Sub-directory of that subsystem in which this file resides.
<b>DOCUMENTATION GROUP:</b>	Name of documentation group of which this source file is a member.
<b>DESCRIPTION:</b>	A description of the module as obtained

PS 620144402  
1 November 1985

from the source code.

<b>ARGUMENTS:</b>	The arguments with which this routine is called if it is a Subroutine or a Function.
<b>INCLUDE FILES:</b>	A list of all the files that are included into this module as well as their purposes.
<b>ROUTINES CALLED:</b>	Subroutines or Functions, either documented or external, called by this module, if any.
<b>CALLED DIRECTLY BY:</b>	The documented routines which call this module, if any.
<b>USED IN MAIN PROGRAM(S):</b>	The documented Main Programs which contain this module in their parts list according to the list in section 3.10.7.

The Module Documentation is arranged alphabetically according to Module Name.

INPUTS:

```
FIELD *FDP; ** THE FORM YOU WISH EXPANDED **
FIELD **USELST; ** WHERE TO LOOK FOR EXPANDING
                 SUBFORMS
```

DESCRIPTION

THIS GUY IS RESPONSIBLE FOR EXPANDING AN ARRAY WHICH WAS PARTIALLY CONSTRUCTED BY FLAN. IT TAKES A POINTER TO THE FORM TO BE EXPANDED AND A POINTER TO THE POINTER TO THE LIST FROM WHICH SUBFORMS MAY BE TAKEN. IF A SUBFORM IS NOT FOUND THE FIELD'S DISPLAY ATTRIBUTE IS SET TO INPUT. THE CASE WHERE BOTH A FIELD AND THE SUBFORM HAVE PROMPTS IS RESOLVED BY CREATING A SPECIAL FIELD TO HOLD THE FIELD'S PROMPTS. USELST MUST BE A POINTER TO A POINTER BECAUSE DELFLD IS USED AND THAT'S WHAT IT NEEDS.

FILE NAME: STDTYP  
PURPOSE: STANDARD TYPE DEFINITIONS  
LANGUAGE: C

DESCRIPTION:

---

DESCRIPTION

THIS FILE ENSURES THAT THE FOLLOWING STANDARD TYPES ARE  
AVAILABLE:

FLOAT	- SINGLE PRECISION FLOAT
DOUBLE	- DOUBLE PRECISION FLOAT
LONG	- 32 BIT (OR LARGER) SIGNED INTEGER
LBITS	- 32 BITS (OR MORE) FOR BIT MANIPULATION
INT	- NATURAL SIZE SIGNED INTEGER
UNSIGNED	- NATURAL SIZE UNSIGNED INTEGER
BOOL	- NATURAL SIZE LOGICAL (ZERO / NON-ZERO ONLY)
SHORT	- 16 BIT (OR LARGER) SIGNED INTEGER
USHORT	- 16 BIT (OR LARGER) UNSIGNED INTEGER
BITS	- 16 BITS (OR MORE) FOR BIT MANIPULATION
CHAR	- SINGLE MACHINE CHARACTER (REAL CHARACTERS ALWAYS POSITIVE)
TINY	- 8 BIT (OR LARGER) SIGNED INTEGER
UTINY	- 8 BIT (OR LARGER) UNSIGNED INTEGER
TBITS	- 8 BITS (OR MORE) FOR BIT MANIPULATION
TBOOL	- 8 BIT (OR LARGER) LOGICAL (ZERO / NON-ZERO ONLY)
METACHAR	- 16 BIT (OR LARGER) AUGMENTED CHARACTER (SIGNED)
VOID	- FUNCTION THAT RETURNS NO VALUE
FORTRAN	- STORAGE CLASS FOR FOREIGN (NON-C) ROUTINES OR C ROUTINES WHICH ARE CALLABLE FROM FOREIGN ROUTINES

SINCE NOT ALL COMPILERS SUPPORT USHORT, TINY, AND UTINY,  
THE FUNCTIONS

PS 620144402  
1 November 1985

**USHORT(), TINY(), AND UTINY() SHOULD BE USED WHENEVER  
REFERENCING THEM.**

**IN ADDITION, THE FOLLOWING UTILITY MACROS ARE DEFINED:**

**LURSHIFT(N, B) - UNSIGNED LONG RIGHT SHIFT**

**MAX(A, B) - MAXIMUM OF A AND B**

**MIN(A, B) - MINIMUM OF A AND B**

PS 620144402  
1 November 1985

**FORMS DRIVEN FORM EDITOR Include File Description**

<b>ABS(A)</b>	- ABSOLUTE VALUE OF A
<b>STRASN(A, B)</b>	- TRANSPORTABLE A - B FOR STRUCTURES
<b>NULL</b>	- NULL POINTER VALUE (0)
<b>TRUE</b>	- 1
<b>FALSE</b>	- 0
<b>SUCCESS</b>	- EXIT(SUCCESS) INDICATES SUCCESSFUL COMPLETION
<b>FAILURE</b>	- EXIT(FAILURE) INDICATES ERRORS

**THE FOLLOWING SYMBOLS SHOULD BE DEFINED BASED ON THE  
COMPILER BEING USED:**

<b>USHORT</b>	- COMPILER SUPPORTS UNSIGNED SHORT
<b>TINY</b>	- COMPILER TREATS CHAR AS SIGNED
<b>UTINY</b>	- CHAR IS SIGNED AND COMPILER SUPPORTS UNSIGNED CHAR
<b>VOID</b>	- COMPILER SUPPORTS VOID
<b>FORTRAN</b>	- COMPILER SUPPORTS FORTRAN
<b>STRASN</b>	- DEFINE APPROPRIATE MACRO
<b>SUCCESS</b>	- DEFINE APPROPRIATE VALUE IF NOT 0
<b>FAILURE</b>	- DEFINE APPROPRIATE VALUE IF NOT 1

### 3.10.10 Hierarchy Chart

The following hierarchy charts show the relationships between all of the modules mentioned in the above documentation. A module may call a subroutine several times within its code, but the call will only be shown once as a single relationship on this hierarchy chart. All modules shown at the top of the first page are considered Main Programs as described in section 3.10.1 above.

There is an internal paging scheme as marked by the numbers in the upper right corner of each page. An index after the last page of the chart shows where a routine and its calls are first defined. If a routine has no page reference, it either makes no calls or is an external routine. A continuation box on the end of a tree limb shows where that the tree continues on the page numbered mentioned. A number in a box with a routine name points to the page where the routine is further defined within the hierarchy tree. If there is no number in a box, the routine either makes no calls or is an external routine.

## SECTION 4

### QUALITY ASSURANCE PROVISIONS

#### 4.1 Introduction and Definitions

"Testing" is a systematic process that may be preplanned and explicitly stated. Test techniques and procedures may be defined in advance, and a sequence of test steps may be specified. "Debugging" is the process of isolation and correction of the cause of an error.

"Antibugging" is defined as the philosophy of writing programs in such a way as to make bugs less likely to occur and when they do occur, to make them more noticeable to the programmer and the user. In other words, as much error checking as is practical and possible in each routine should be performed.

#### 4.2 Computer Programming Test and Evaluation

The quality assurance provisions for test consists of the normal testing techniques that are accomplished during the construction process. They consist of design and code walk-throughs, unit testing, and integration testing. These tests are performed by the design team. Structured design, design walk-through and the incorporation of "antibugging" facilitate this testing by exposing and addressing problem areas before they become coded "bugs."
